List of Experiments:**1. Basic Programs**

1.1) Write a program that asks the user for a weight in kilograms and converts it to pounds. There are 2.2 pounds in a kilogram.

1.2) Write a program that asks the user to enter three numbers (use three separate input statements). Create variables called total and average that hold the sum and average of the three numbers and print out the values of total and average.

1.3) Write a program that asks the user for two numbers and prints Close if the numbers are within .001 of each other and Not close otherwise.

2. Control Flow

2.1) Write a program that uses a for loop to print the numbers 8, 11, 14, 17, 20, . . . 83, 86, 89.

2.2) Write a program that asks the user for their name and how many times to print it. The program should print out the user's name the specified number of times

2.3) Write a program to find the given number is Armstrong number or not.

3. Control Flow Continued

3.1) Use a for loop to print a triangle like the one below. Allow the user to specify how high the triangle should be.

```
*  
**  
***  
****
```

3.2) Generate a random number between 1 and 10. Ask the user to guess the number and print a message based on whether they get it right or not.

3.3) Write a program to convert a given number into a given base.

Note: Convert the given number into a string in the given base. Valid base is $2 \leq \text{base} \leq 36$ Raise exceptions similar to how `int("XX", YY)` does (play in the console to find what errors it raises). Handle negative numbers just like `bin` and `oct` do.

4. Strings

4.1) Write a program that asks the user to enter a word and prints out whether that word contains any vowels.

4.2) Write a program that asks the user to enter two strings. The program should then check to see if the strings are of the same length. If they are not, the program should print an appropriate message and exit. If they are of the same length, the program should alternate the characters of the two strings and print the strings character-wise alternatively. For example, if the user enters `abcde` and `ABCDE` the program should print out `AaBbCcDdEe`

4.3) Write a program that asks the user for a large integer and inserts commas into it according to the standard American convention for commas in large numbers. For instance, if the user enters `1000000`, the output should be `1,000,000`.

5. Data structure

5.1) Write a program that generates a list of 20 random numbers between 1 and 100.

- (a) Print the list.
- (b) Print the average of the elements in the list.
- (c) Print the largest and smallest values in the list.
- (d) Print the second largest and second smallest entries in the list
- (e) Print how many even numbers are in the list.

5.2) Write a program that asks the user for an integer and creates a list that consists of the factors of that integer.

5.3) Write a program that generates 100 random integers that are either 0 or 1. Then find the longest run of zeros, the largest number of zeros in a row. For instance, the longest run of zeros in [1,0,1,1,0,0,0,1,0,0] is 4.

6. Data Structure-Continued

6.1) Write a program that removes any repeated items from a list so that each item appears at most once. For instance, the list [1,1,2,3,4,3,0,0] would become [1,2,3,4,0].

6.2) Write a python script to perform following operations:

i) Create a matrix and print it

ii) Perform Addition of 2 matrices

iii) Perform multiplication of 2 matrices

6.3) Write a program to sort given list of strings in the order of their vowel counts.

7. Functions

7.1) Write a function called sum_digits that is given an integer num and returns the sum of the digits of num.

7.2) Write a function called first_diff that is given two strings and returns the first location in which the strings differ. If the strings are identical, it should return -1.

7.3) Write a function called number_of_factors that takes an integer and returns how many factors the number has.

7.4) Write a function called is_sorted that is given a list and returns True if the list is sorted and False otherwise.

8. Functions-Continued

8.1) Write a function called root that is given a number x and an integer n and returns $x^{1/n}$. In the function definition, set the default value of n to 2.

8.2) Write a function called primes that is given a number n and returns a list of the first n primes. Let the default value of n be 100.

8.3) Write a function called merge that takes two already sorted lists of possibly different lengths, and merges them into a single sorted list.

(a) Do this using the sort method.

(b) Do this without using the sort method

8.4) Write a program that asks the user for a word and finds all the smaller words that can be made from the letters of that word. The number of occurrences of a letter in a smaller word can't exceed the number of occurrences of the letter in the user's word.

9. Files

9.1) Write a program that reads a file consisting of email addresses, each on its own line. Your program should print out a string consisting of those email addresses separated by semicolons.

9.2) Write a program that reads a list of temperatures from a file called temps.txt, converts those temperatures to Fahrenheit, and writes the results to a file called ftemps.txt.

9.3) Write a program to count frequency of characters in a given file.

10. OOP

10.1) Write a class called Product. The class should have fields called name, amount, and price, holding the product's name, the number of items of that product in stock, and the regular price of the product. There should be a method `get_price` that receives the number of items to be bought and returns a the cost of buying that many items, where the regular price is charged for orders of less than 10 items, a 10% discount is applied for orders of between 10 and 99 items, and a 20% discount is applied for orders of 100 or more items. There should also be a method called `make_purchase` that receives the number of items to be bought and decreases amount by that much.

10.2) Write a class called Time whose only field is a time in seconds. It should have a method called `convert_to_minutes` that returns a string of minutes and seconds formatted as in the following example: if seconds is 230, the method should return '5:50'. It should also have a method called `convert_to_hours` that returns a string of hours, minutes, and seconds formatted analogously to the previous method.

10.3) Write a class called Converter. The user will pass a length and a unit when declaring an object from the class—for example, `c = Converter(9,'inches')`. The possible units are inches, feet, yards, miles, kilo meters, meters, centi meters, and milli meters. For each of these units there should be a method that returns the length converted into those units. For example, using the Converter object created above, the user could call `c.feet()` and should get 0.75 as the result.

List of Augmented Experiments

(Any two of the following experiments can be performed)

11. Write a program to count how many times each word present in a file.

12. Write a recursive python function which returns True if the input is well-formatted with respect to the list labels. Else it should return False. An input is a well-formatted with respect to the labels, if it follows below conditions:

(a) input item is a list.

(b) input item has length at least two.

(c) input's first item is in the list labels.

13. Write a program to find the greatest number that can be formed by using given set of numbers

14. Write a program to find sum of digits of a number till you get single digit sum.

Example:

Input : 142 (Hint: $1+4+2=7$)

Output : 7

Input : 4683 (Hint: $4+6+8+3=21 \Rightarrow 2+1=3$)

Output : 3

15. OOP Continued

15.1) Write a Python class to implement `pow(x, n)`.

15.2) Write a Python class to reverse a string word by word.

Guidelines:

1. The Internship is a team activity of 3 to 4 students.
2. The students can undergo Industrial Training / Internship at Govt. Organizations, software MNCs or do Research projects in National Laboratories/Academic Institutions like IITs, NITs etc. during summer breaks after completion of IV Semester.
3. INDUSTRY INTERNSHIP Project is an alternative to the Summer Internship, whenever there is an exigency and students cannot pursue their Summer Internship. A group of students or even a single student can take up the Community Service Project during summer breaks. However, a student can opt for this only once. The students have to identify social problems existing in any geographical area/village and try to solve them technically or suggest people to the necessary solutions for solving these problems.

4. Prior letter and approval from the Head of the Department must be taken before applying to any organization for the course.
5. Every student should put in a minimum of 180 hours for the INDUSTRY INTERNSHIP Project during the summer vacation.
6. Each class/section should be assigned with a Project Coordinator.

Guidelines for Project:

The prime objective of this project work is to imbibe students with technical, analytical and innovative ideas. It's to ensemble the students with theoretical and practical learning pertaining to software applications development, design practices and guidelines/paradigms. A peer of 3-4 students formed as group/team and work under the supervision/mentoring of a departmental faculty. Associating the students to solve from real world problems to various R&D problems identified within the department or sister departments. The team is formed towards fostering the communication and leadership skills among peers, so that they can survive and exercise during their career, abreast. The project work normally includes:

1. Literature survey on existing problem/ topic from viable sources.
2. Eliciting the problem solving approach/methodologies and making the feasibility study.
3. The team should perform an extensive software requirements analysis and ethnographical study.
4. Preparing an abstract/synopsis on the opted topic and present before Departmental Review Committee (DRC).
5. Preparing a roadmap to design, analyze, implement, evaluate/test considering functional, non-functional aspects and finally, deploy the application/product/software service.
6. Detailed Analysis/Design/Modelling/Simulation and experimentation as needed.
7. Final development of product/process conducting testing and specifying the results,

conclusions and future directions.

8. Preparing a Dissertation in the standard format for being evaluated by the Department Review Committee (DRC).
9. Final Project presentation / execution before Departmental Review Committee (DRC).
